Kathmandu Fruit Store inventory system is an inventory software of Kathmandu Fruit store that stores data of fruit imports. Kathmandu Fruit store is a big seller of fruits which imports fruits from local and international and sold it to the local vendors. This inventory system helps for storing data in digital form.

1. First, you must fill all the fields to display value. For that FruitID should put as an integer and it should be unique each time.
2. The price and quantity should be also integer.
3. For selecting data, you have to click on the calendar icon and choose the date.
4. After then your value inserting work is finished just click on the add to table button and the value will be displayed in the table.
5. You can choose price range of fruit from radio button which has low, medium and high.
6. You can choose types of fruit from combo box which are Local, Common, Exotic, Citrus and Berries.
7. You can delete text field data by clicking on each field or simply pressing the button clear field.
8. You can clear the data of the table by clicking on, clear table button.
9. You can search the Fruit whole details by simply putting value on search field and pressing the button search. It will show the first matching price details from the table.
10. You can also search fruit names by their types for that just choose types by pressing on the box area and then press the search button and it will show the name of the fruit-related with those types.
11. You can also save the data of the table by just clicking on file and inside that click on save or press CTRL+ S and it will save table data.
12. You can import the saved table data by just click on the file and inside that click on import, or simply press CTRL+ I, it will display all the saved data inside the table.
13. You can also choose any file and open that file from the system too, for that just click on file and inside click on open or simply press CTRL + O and it will open your system file manager so that you can choose any files and open that from the system.

14. You can exit from the system by click on the file and inside there is an exit if you want to leave from the system click on that or simply click on CTRL + E and the system will be closed.
15. You can know about the system too, for that click on Help and inside that click on About or simply press CTRL + A and it will display all the details and system and its developers.
16. You can open the user manual to for that click on Help and inside that click on Help or simply press CTRL + H and it will display all the user manual for any help to the user.
